A German research institute has developed a bipolar plate made of thermoplastic & graphite compounds and weldable membrane-electrode assemblies that allow for the development of welded electrolyser stacks. Welded seams can lead to tighter stacks, which facilitates the mass production of electrolytic cells. The aim is to bring the technology to TRL 6. Sought are partners with expertise in porous transport layers and polymers to submit a project to Call HORIZON-JU-CLEANH2-2025-01-01.
